

01 Executive Summary

Built, deployed and running on AWS today - eight microservices, a VRPTW optimization engine, live video from every aircraft, and event-driven re-planning that reacts within seconds. Not a design or a prototype: demonstrable end to end, on request. **SwarmOps decides, in real time, which drone flies which mission**, in what order and along which route, while managing battery, range and priority as they shift. **Built by four combat veterans, three of them former IDF drone operators** - a coordination failure we were on the wrong end of, not one we researched.

02 The Challenge

- Nobody sees the whole airspace.** Every drone flies on its own controller. No screen anywhere shows everything currently airborne - who is flying it, and what it is tasked to. The fleet-level questions simply go unanswered: who covers what, who already swept it, whose report is current.
- This is not a fleet-size problem. It is a coordination problem.** Ten people flying one drone each in the same sector are a swarm with no brain. Nobody owns a fleet; each operator is doing their job correctly - the failure sits in the space between them, which no single-operator tool has reason to look at. **The IDF has tendered for 12,000 FPV aircraft**, one operator each, with nothing above them.
- Nobody sells the layer above.** Every tool in this market is bought by, installed by and scoped to a **single operator** - manufacturer software included, whose job is to make *their* aircraft fly well. A layer serving several independent operators is a different product with a **different buyer**: the person accountable for the airspace, who may own none of the aircraft. That is not an oversight anyone corrects by accident.
- The cost in the field:** wasted flight time, duplicate coverage, needless airframe wear - and worst of all, an operational picture nobody can fully trust.

03 The Solution & Product

VENDOR-NEUTRAL LAYER

A vendor-neutral coordination and optimization layer

- Assignment & routing engine (VRPTW):** computes optimal routes, allocates missions automatically, and folds charging or battery-swap stops into the plan in real time - maximum air time, minimum risk.
- Dynamic re-planning:** live telemetry and field events update the mission board within seconds of a technical fault, an abnormal battery drain, loss of signal, or an urgent shift in operational priorities.
- Unified control room:** one live operational picture - every aircraft, mission, planned route and restricted zone on a single map, **plus the live camera feed from any drone the commander selects**, tied to that aircraft's identity and current mission - and dashboards tracking mission status, readiness and remaining air time. All drones stream concurrently; the commander chooses which to watch.
- Hardware agnostic - specifically:** professional aircraft speak MAVLink; DJI and Autel are closed but publish SDKs. Each becomes a thin adapter normalizing telemetry into one format and routing that aircraft's video into the existing feed relay. A mixed fleet appears as one fleet, not three consoles.
- Deploys where the customer operates:** cloud, on local servers in closed networks (on-premise), or on edge nodes in the field - containerized, with automated delivery pipelines and full observability.

Why We Built This

This is not a theoretical scenario for us. On 7 October 2023, during the fighting in the kibbutzim, two teams from the same army company launched drones at the same time. With no coordination between them, both swept the same sector - one team identified hostiles, the other reported a friendly force in the same place. The contradiction in the situational picture delayed a critical operational decision - one that could have saved lives and carried the mission forward. **That is the problem SwarmOps was built to solve.**

04 Applications & Market Potential

DUAL-USE

Why now: the IDF has tendered for 12,000 FPV aircraft and is building its own line - hardware is commoditising, coordination is not. Israel has run nationwide BVLOS trials since 2020, years ahead of the US rule. Israeli defense-tech took ~30% of all local private investment in H1 2026.

Defense, emergency & C4I	One unified operational picture across separately-controlled aircraft, coordinated sweeps and rapid response; intelligent fleet logistics (battery and airframe health); <i>a learning layer over flight history for after-action review and sector-specific optimization (future).</i>
Construction & infrastructure (ConTech)	Autonomous mapping keyed to project milestones: earthwork volume calculation, progress verification for releasing lender funds, as-built comparison against engineering plans (BIM), and defensible documentation for disputes.
Infrastructure & energy	Recurring monitoring, defect detection and preventive maintenance across power lines, oil & gas pipelines, national assets and solar farms.
Precision agriculture	Coordinated multispectral surveys for pest detection, and scheduled autonomous spraying at scale.
Logistics & delivery	Autonomous site-to-site transport and last-mile optimization across the supply chain.

05 Roadmap - 12 Months

Months 0-3

Connect real aircraft (DJI and Autel SDKs; MAVLink for custom airframes), run first field trials, begin engagement with the Civil Aviation Authority.

Months 3-6

First pilot with a strategic partner or design customer, proving out agreed success metrics.

Months 6-12

Multi-Tenant product, commercial pricing, and a Pre-Seed / Seed round.

06 Team

Four co-founders, all engineers and combat veterans, three of them former IDF drone operators - we are the users this product is built for. Tony Verin | Guy Peres | Harel Valfish designed, built and operate the entire system end to end: algorithms, cloud architecture, user interfaces and infrastructure. Amir Shacham - DevOps engineer, business and economics at Reichman University - owns commercial strategy, pricing and fundraising.

07 The Ask

FUNDING A MILESTONE, NOT A RUNWAY

\$12K min

NOW - NON-DILUTIVE

Three aircraft, a Remote ID receiver, cloud, incorporation, CAAI licensing and insurance. **Buys one milestone in ~4 months: three separately-controlled aircraft flying at once, all visible in one live picture - the coordination problem above, on real hardware.** The integration surface already exists; a real drone connects as a new data producer, not a rebuild.

Developed under the Discharged Combat Veterans Program. **Live demonstration available on request.**

\$250K

PRE-SEED, AFTER THAT MILESTONE

12 months with the founders full-time - the round is for salaries and a first paid design partner, not hardware. We would rather raise against a flying aircraft than a slide of one, which is why the first number is deliberately small.

Now

WHAT HELPS MOST BESIDES MONEY

One design partner operating 3+ aircraft - a security operator, an infrastructure company, or a unit - to run a scoped pilot with success criteria agreed up front. That introduction is worth more to us than the first cheque.

TAM

The category we sell into

\$2.5-3.9B / year

Global drone fleet operations software, 2026, growing ~18% a year. That category also covers flight logging and photo processing; **the coordination layer we sell is an estimated 10-20% of it - some \$250-780M**, not tracked separately by any analyst. **We do not count aircraft**: the \$96B drone market is hardware we neither build nor sell.

SAM

Who we can actually sell to

\$6-20M Israel, recurring

300-800 Israeli organizations coordinating 3+ aircraft, at \$20-25K each per year (est.). Europe and the US add an estimated \$320-800M. **Not counted in either figure**: shared sites and sectors where several independently-controlled drones fly at once - possibly the larger half of the market, and the first thing we intend to measure.

SOM

What we plan to win

\$0.6-1.5M ARR by year 3

Annual recurring revenue, not a one-off sale - 20-40 subscribing customers, of which 2-3 defense or on-premise (est.), roughly 5-15% of the Israeli market. **This figure is limited by our headcount, not by the market**: every row of the expansion track below converts into more addressable customers, and what blocks them is four people choosing what to build next.

Why Israel First

BEACHHEAD, NOT A LIMIT

- **Israeli operators reach fleet scale before American ones.** BVLOS - flying beyond visual line of sight - is what makes fleets grow. The US rule is still unpublished; Israel's National Drone Initiative has run nationwide managed-airpace BVLOS trials since 2020, including flights in GPS-denied conditions.
- **Israel's requirements are genuinely different**, not a translation job: mixed civil/military airspace, restrictions declared at short notice, thin route margins - and satellite-navigation interference as a standing condition. IATA reports GNSS interference up **193% in 2025 against 2023**, with the Eastern Mediterranean among the worst-affected regions worldwide.
- **The timing in this sector is unusual.** Israeli defense-tech companies raised roughly \$3B in the first half of 2026 - close to 30% of all private investment in Israeli high-tech.
- **National funding tracks fit this stage.** The Israel Innovation Authority's deep-tech track runs to NIS 2M at Pre-Seed and NIS 6M at Seed, plus new incubators covering robotics and defense-tech.
- **The aircraft are being commoditised in front of us.** Not in the primes' expensive precision systems - those are low-volume and unit-selective - but in cheap drones bought in thousands (5,000 at ~\$3,500; a further 12,000 at ~\$20-25K), plus in-house production to cut cost further. Hardware is becoming the replaceable part; the layer above it is not.
- **Israel is the market we win; export makes it large.** Nothing here closes off Europe or the US - a platform proven in the hardest airspace anyone operates in is what makes it sellable abroad.

What This Market Already Pays

RECURRING, NOT ONE-OFF

All figures are **subscription revenue** - paid for as long as the customer operates, not one-time sales. None of the products below does what SwarmOps does; they show what this buyer already pays for drone software.

Industry pricing band (trade guides, not research firms)	\$50-500 per aircraft / month
DroneDeploy - not a competitor : post-flight mapping from drone photos, a different job entirely. Cited as the category's best-known name, and because its automated flight planning works with DJI aircraft only - the vendor lock we exist to remove	\$329-599 per user / year published tiers; team and enterprise quoted privately
Our working price point (est.)	\$150 per aircraft / month
Customer with 10 aircraft	~\$20K / year, recurring
Defense, per site or formation (on-premise)	\$100-300K / year, recurring
Defense, force level - a program, not a subscription. Upside, not plan	\$1-5M / year (est.)

Why This Gap Is Still Open

AND HOW WE WOULD STAY AHEAD

Every tool in this market is bought by, installed by, and scoped to a single operator. A layer that sits *above* several independent operators is a different product with a different buyer - the person accountable for the airspace, who may own none of the aircraft. Manufacturers have not built it and are structurally not placed to: their software's job is to make *their* aircraft fly well. **This is not an oversight anyone corrects by accident** - it is a structural gap, and it is the one we occupy.

And once we are in, the product compounds. Every plan the system issues and every position report it receives is already stored. A version that plans from what an airframe *actually* achieves in a given sector and season - rather than from its specification - gets measurably better with each month a customer uses it. That is the honest answer to how a software company without hardware stays hard to replace: not a patent, but an operating record no newcomer has. The data is accumulating today; the modelling is not built.

Expansion Track

NEAR TERM

Not funded, not promised. Listed in the order we would do it - each step is the easiest money available at that point, and builds on the one before.

Yr 2 — sell more to existing customers Warn which drones are about to fail; live restricted-zone updates	Existing customers pay 15-30% more. No new customers to find, no new market to enter
Yr 2, second half — sell to the airspace owner One system serving several separate units or companies at once	Today we can only sell to whoever owns the drones. This lets us sell to the commander or site manager responsible for everyone flying there - a buyer that products scoped to a single operator are not built to serve. The engineering lands inside the 12-month plan ; what gates the sale is a reference customer, not code
Yr 2-3 — open the defense market Runs on the customer's own servers, offline; survives GPS/comms jamming	Without this, defense customers cannot buy from us at all. An entry requirement, not an improvement

Yr 3+ — beyond drones Support for other vehicle types	The software does not care that it is flying. Ground robots, warehouse fleets and unmanned boats have the same problem - a much larger market, same core. Left for last on purpose: focus is what wins the first customers
Yr 3+ — moving-vehicle recovery Landing on a moving truck, ship or trailer	Planning systems assume a drone comes back to a fixed base. A force that moves does not have one. A hard research problem, not a setting
Long horizon — a national layer One picture of everything airborne in Israel	Not one system per organization, but a layer every Israeli operator connects to - built around Israel's own conditions rather than adapted from a foreign product. Israel is small enough for this to be possible, and the body that would convene it already exists. An ambition, not a plan

The principle: sell more to the customers we already have before chasing new ones, and enter the most valuable market only once we can meet its requirements.

How We Built These Figures

METHOD

A note on how we would charge. Per-aircraft pricing fits reusable inspection and patrol drones. It does not fit an aircraft consumed in a single flight - there the billable unit is per formation, per site or per program. Applying a per-aircraft subscription to a 12,000-drone holding produces a number in the tens of millions, which is why we do not quote one.

How these figures were built. Sourced figures come from named research firms and regulators. Figures marked *est.* are our own bottom-up estimates from those inputs, with the assumptions written down and available in full. Published estimates for this category vary widely by definition, so we give ranges rather than single numbers - and we say which is which.

What We Still Need To Verify

STATED UP FRONT

- **How many shared operating areas there are.** No public source counts sites and sectors where several separately-controlled drones fly at once - which is exactly why we intend to count them. It may be the larger half of our market, and it is not in any figure above.
- **What a buyer pays for coordination specifically,** as distinct from the rest of a drone software stack. Answered the first time we price a real deal.
 - **Whether operators see this as a problem to fund** - or as simply how the work has always been done. This is the question the first pilot is designed to answer, and we would rather find out early than assume.

Sources. Market size: Fact.MR; Market Growth Reports; Grand View Research; MarketsandMarkets (Israel UAV). Registrations: FAA (Dec 2025); EASA. Pricing: DroneDeploy tiers via Capterra; per-aircraft band from trade guides (Dronedesk, DroneBundle) rather than research firms. Aircraft-integration protocols: published MAVLink, DJI Payload/Mobile SDK and Autel Enterprise SDK documentation. GNSS interference: IATA safety reporting as covered by aviation press. Israeli BVLOS trials: National Drone Initiative / C4IR / Israel Innovation Authority. IDF drone procurement: Jerusalem Post; Times of Israel; Militarnyi. Defense-tech investment: Haifa DefenseTech Forum (H1 2026). **Method.** Figures marked *est.* are our own bottom-up estimates from those inputs, not published market data; assumptions available in full on request. Published estimates for this category vary by definition, so ranges are given rather than single figures.
