

A coordination layer for a safer, unified airspace

PRIMARY BEACHHEAD: DEFENSE, EMERGENCY & C4I → EXPANSION: CONTECH · ENERGY · AGRICULTURE · LOGISTICS

SwarmOps is a vendor-neutral coordination and optimization layer for autonomous drone fleets, leveraging four founders' hands-on operational experience and a system already built, deployed and running on AWS.

Our thesis is simple: hardware is commoditising fast, but nobody sees the whole airspace. Every drone flies on its own controller, with no fleet-level view of who covers what, who already swept it, or whose report is current. **SwarmOps decides, in real time, which drone flies which mission** — managing battery, range and priority as they shift, and re-planning within seconds when the picture changes. We're going to market with the units and commanders who own this failure today, then expanding into ConTech, energy, agriculture and logistics.

The Coordination Gap — Before & After SwarmOps

SwarmOps Focus Areas

Defense-first, built by the operators who own the failure — expanding from there.

PRIMARY BEACHHEAD

Defense, Emergency & C4I

Where three of our four founders operated the failure firsthand — the first design partners and the first revenue.

EXPANSION VERTICALS

Construction & Infrastructure

Infrastructure & Energy

Precision Agriculture

Logistics & Delivery

SwarmOps Round Terms

Raise Amount	\$250K	Instrument	SAFE
Stage	Pre-Seed	Runway	12 months, founders full-time
Geography	Israel, export-ready	Use of Funds	Salaries + first design partner

The Challenge

- **No one sees the whole airspace.** Every drone flies on its own controller — no shared picture of who's flying what.
- **A coordination problem, not a fleet-size one.** Independent operators in one sector are a swarm with no brain.
- **Nobody sells the layer above.** Every tool is scoped to a single operator, not the person who owns the airspace.

The Solution

- **VRPTW routing engine** — optimal routes, automatic mission & battery planning.
- **Dynamic re-planning** — the mission board updates within seconds of a fault or shifting priority.
- **Unified control room** — one live map, every aircraft, any camera feed on demand.
- **Hardware-agnostic** — MAVLink, DJI & Autel, one console.

The Live Operating Picture

A real screenshot from the SwarmOps control room, mid-mission: every aircraft plotted on the operating-area grid, patrol routes and no-fly zones overlaid, live status per drone (flying, charging, in-progress, complete), and mission hand-offs — like the patrol replacement and charger-swap shown here — happening automatically as battery runs low.

Roadmap — 12 Months

Months 0-3

Connect real aircraft, run first field trials, engage the Civil Aviation Authority.

Months 3-6

First pilot with a strategic partner or design customer.

Months 6-12

Multi-tenant product, commercial pricing, next round.

TEAM

Four co-founders, all engineers and combat veterans, three of them former IDF drone operators — we are the users this product is built for. Tony, Guy and Harel design, build and operate the entire system end to end: algorithms, cloud architecture, user interfaces and infrastructure. Amir owns commercial strategy, competitive benchmarking, pricing and investor relations.

Tony Verin
CEO

Operational drone pilot with real-world deployment experience, and veteran sniper background. Certified AWS Solutions Architect and DevOps engineer who built SwarmOps to solve the airspace gaps he lived in the field. Co-architects and operates the entire platform end-to-end — algorithms, cloud infrastructure, and live command interfaces.

- SNIPER
- DRONE OPERATOR
- AWS / DEVOPS

Guy Peres
COO

Former Search and Rescue combat medic, IDF. AWS Certified Solutions Architect and DevOps Developer Expert (IITC). Career spanning cloud infrastructure and digital marketing leadership, bringing both technical execution and go-to-market perspective. Owns day-to-day operations, turning strategy into execution, leading internal teams, and keeping delivery, roadmap and process on track.

- SEARCH & RESCUE MEDIC
- AWS / DEVOPS

Harel Valfish
Head of R&D

Former IDF drone operator. Co-designs, builds and operates the entire system end to end, owning the algorithms, cloud architecture and infrastructure behind the VRPTW routing engine and control room.

- IDF DRONE OPS
- R&D

Amir Shacham
CDO

Paratrooper veteran with a business degree, AWS Solutions Architect and DevOps certified (IITC). VC and startup background spanning DevOps and solutions architecture. Owns commercial strategy, competitive benchmark analysis, pricing, investor relations and fundraising.

- AWS SA
- DEVOPS CERT.
- PARATROOPER

Competitive Benchmark

Swarmer and FlytBase are real, funded, credible players in adjacent lanes — not strawmen. Here's exactly where SwarmOps overlaps with each, and where it doesn't.

Capability	SwarmOps	Swarmer (combat swarm autonomy)	FlytBase (enterprise fleet ops)	OEM app (DJI / Autel native)
Coordinates aircraft owned/operated by different, independent units	Yes	No — one operator's own swarm	No — one org's fleet & docks	No
One operator, real-time control of many drones	Yes	Yes — 100+, combat-proven	Yes — 30+ (Fleet View 2.0)	No — 1:1
Dynamic mission/route optimization (VRPTW: battery, range, time-window reassignment)	Yes	Partial — target/task allocation for kinetic engagement	Partial — automates single-mission paths, not fleet-wide re-optimization	No
Built for ISR, inspection & logistics missions (non-kinetic)	Yes	No — combat/strike focus	Yes	Partial
Hardware-agnostic (DJI + Autel + MAVLink, one console)	Yes	Yes — vendor-agnostic	Yes — DJI + PX4/Ardupilot	No — single vendor
Live concurrent video from every aircraft, unified	Yes	Not publicly disclosed	Yes — Video Wall / Multi-Cam	Single aircraft
On-premise / GPS-denied / EW-resilient deployment	Yes	Yes — combat-proven under jamming	Partial — enterprise/cloud-first	Varies

Why this gap is still open. Swarmer (NASDAQ: SWMR, \$15M+ raised, 100,000+ real combat missions) builds combat swarm autonomy for one operator's own kinetic fleet. FlytBase automates one organization's owned, docked fleet. Neither coordinates aircraft that are independently owned and operated by different units or companies sharing the same airspace, and neither runs a VRPTW-style engine optimizing missions across battery, range and shifting priority for ISR/inspection/logistics work. That's the layer SwarmOps occupies. Pricing reference: industry band \$50-500/aircraft/month; SwarmOps working price point (est.) \$150/aircraft/month, ~\$20K/year at 10 aircraft, \$100-300K/year for on-premise defense sites.

Why We Built This

On 7 October 2023, two teams from the same army company launched drones into the same sector with no coordination between them — one identified hostiles, the other reported a friendly force in the same place. The contradiction delayed a critical decision. **That is the problem SwarmOps was built to solve.**

Market Snapshot

TAM \$2.5-3.9B Global drone fleet-ops software, 2026, growing ~18%/yr. The coordination layer is an est. 10-20% of it.	SAM \$6-20M Israel recurring; 300-800 orgs coordinating 3+ aircraft at \$20-25K/yr each (est.). Europe/US add far more.	SOM \$0.6-1.5M ARR by year 3 — 20-40 subscribing customers, limited by headcount, not by the market.
